

ABSTRACT OF THE DISCLOSURE

A video cloaking system for actively detecting unwanted background details in response to user selections, and replacing all or portion of the background with user selected content, such as static scenes, animations, or video. The user can represent themselves as they see fit, while hiding the normal background and adding entertainment value. A web enabled content system is also described that is configured to overlay web obtained content for preprogrammed video or audio content when it synchronizes with it. The user can humorous or meaningful content added to the content they view or listen to. Numerous additional system and methods are described.
